[LinkedIn](#)

Middle .NET Software Developer with **2 years** of experience in full-cycle development, focused on delivering business-oriented solutions.

My primary expertise lies in building not just functional but efficient and reliable systems that directly impact key business metrics. I achieve this by optimizing internal processes, enhancing system stability, and ultimately improving the end-user experience.

I possess a deep interest in modern API development practices and actively utilize monitoring and observability tools (**OpenTelemetry**, **Grafana**) to collect metrics, analyze performance, and proactively identify issues. This data-driven approach allows me to build predictable and fault-tolerant systems.

A strong advocate for teamwork and open communication, I thrive in environments where I can tackle complex challenges and contribute to building scalable, technologically advanced products. I am a continuous learner and always eager to embrace new challenges.

Experience

• Middle .NET Software Developer

NDA

Nov, 2024 - present

- Designed and implemented a complex mission-critical control system from the ground up, establishing a complete and secure data lifecycle management process.
- Engineered a robust background service for high-volume batch file processing, implementing transactional logic with a comprehensive rollback mechanism to guarantee data integrity and consistency.
- Optimized long SQL queries and database structures, resulting in a significant reduction in query execution time and improved overall application responsiveness.
- Integrated advanced caching strategies using Redis, which dramatically decreased response times and reduced the load on the primary database system.
- Developed the user interface: created and integrated new components, services, modules on Angular. Implemented client business logic and interaction with the backend API (REST) via HTTP requests. Participated in the support and refactoring of existing code to improve performance and readability.
- Architected a centralized health monitoring system for all key components (database, application, external services). This enabled real-time performance metric tracking and proactive incident response, drastically reducing mean time to resolution.
- Actively contributed to all phases of the product lifecycle within a Scrum framework.
- Mentored and onboarded new team members, providing guidance on code standards, architectural patterns, and business logic to facilitate rapid integration and productivity.

Stack: C#, ASP.NET Core, PostgreSQL, SQL/Dapper, EF Core, Minio, Redis, CQRS, Jira, Docker, Angular, TS

• Junior .NET Software Developer

Polessky State University

Jun, 2023- May, 2024

- Designed and developed a modular internal communications and operations management platform on .NET, integrating with third-party messenger solutions. Introduced a microservices architecture to decouple core functionalities such as notifications, data management, and analytics into independent, scalable services.
- Engineered and deployed automated bots for distributing real-time alerts, generating and sending reports, and delivering personalized reminders to employees, significantly improving operational efficiency.

Stack: C#, ASP.NET Core, PostgreSQL, EF Core
